Verify Builds

- Follow the Piazza procedure on submission
    - Verify your submission compiles and works at the changelist number.
- Verify that only MINIMUM files are submitted
    - No – Generated files
        - *.pdb, *.suo, *.sdf, *.user, *.obj, *.exe, *.log, *.pdb, *.db, *.user
        - Anything that is generated by the compiler should not be included
    - No – Generated directories
        - /Debug, /Release, /Log, /ipch, /.vs
- Typical files project files that are required
    - *.sln, *.cpp, *.h
    - *.vcxproj, *.vcxproj.filters, CleanMe.bat

Standard Rules

Submit multiple times to Perforce
- Submit your work as you go to perforce several times (at least 5)
    - As soon as you get something working, submit to perforce
    - Have reasonable check-in comments
        - Points will be deducted if minimum is not reached

Write all programs in cross-platform C++
- Optimize for execution speed and robustness
- Working code doesn't mean full credit

Submission Report
- Fill out the submission Report
    - No report, no grade

Code and project needs to compile and run
- Make sure that your program compiles and runs
    - Warning level ALL …
    - NO Warnings or ERRORS
        - Your code should be squeaky clean.
    - Code needs to work "as-is".
        - No modifications to files or deleting files necessary to compile or run.
    - All your code must compile from perforce with no modifications.
        - Otherwise it's a 0, no exceptions

Project needs to run to completion
- If it crashes for any reason…
    - It will not be graded and you get a 0

No Containers

- NO STL allowed {Vector, Lists, Sets, etc...}
    - No automatic containers or arrays
    - You need to do this the old fashion way - *YOU EARNED IT*

Leave Project Settings

- Do NOT change the project or warning level
    - Any changing of level or suppression of warnings is an integrity issue

Simple C++

- No modern C++
    - No Lambdas, Autos, templates, etc…
    - No Boost
- NO Streams
    - Used fopen, fread, fwrite…
- No code in MACROS
    - Code needs to be in cpp files to see and debug it easy
- *Exception:*
    - implicit problem needs templates

Leaking Memory

- If the program leaks memory
    - There is a deduction of 20% of grade
- If a class creates an object using new/malloc
    - It is responsible for its deletion
- Any *MEMORY* dynamically allocated that isn't freed up is *LEAKING*
    - Leaking is *HORRIBLE*, so you lose points

No Debug code or files disabled

- Make sure the program is returned to the original state
    - If you added debug code, please return to original state
- If you disabled file, you need to re-enable the files
    - All files must be active to get credit.
    - Better to lose points for unit tests than to disable and lose all points

No Adding files to this project

- This project will work "as-is" do not add files…
- Grading system will overwrite project settings and will ignore any student's added files and will returned program to the original state

UnitTestConfiguration file (if provided) needs to be set by user

- Grading will be on the UnitTestConfiguration settings
    - Please explicitly set which tests you want graded… no regrading if set incorrectly

Submission Report
Keenan

Due Dates

- See Piazza for due date and time
- Submit program perforce in your student directory assignment supplied.
- Fill out your this **_Submission Report_** and commit to perforce
  - *ONLY* use Adobe Reader to fill out form, all others will be rejected.
  - Fill out the form and discussion for full credit.

Goals

- Learn
  - Data cache / Alignment
  - Hot / Cold data structures
- Understand firsthand how alignment and data cache affects performance

Assignments

1. **_Alignment_** *Identifying data layout and alignment for supplied data structures(C++ classes)*
   - Rework the data structures in **_ReworkData.h_**
     - Rearrange the data layout to make the size smaller
     - Explicitly name any padding in the structure
       - char pad0; // for example

   - Create a Print function to show alignment
     - Update the **_Align::PrintMe(…)_** function to print the alignment
     - Use Trace::out2(…) to display the data layout and padding
       - Make sure you use out2() and not out()

         ```
         data A:
           0x00: 00 00 00 00
           0x04: 00 aa aa aa
         -----------------------
         size : 8  padding : 3
         ```

     - Needs to visually show the padding and alignment
       - Total number of bytes
       - Number of padding bytes
     - Mimic the KeenanSampleOutput_Debug.txt

   - No Templates or Boost allowed
     - Use only simple C++ (classes and methods)
     - You cannot leak memory

2. ***HotCold*** *(Rework the supplied linked list data structure to a hot / cold data structure)*
   - Refactoring any necessary conversion/find functions to the linked list
   - Converting the existing data structure data to this new format
   - Feel free to add helper methods
   - No Templates or Boost allowed
     - Use only simple C++ (classes and methods)
     - You cannot leak memory
   - Verify that new data format is the equivalent to the original data structure
   - Profile the before and after performance numbers of the linked list for the given input.

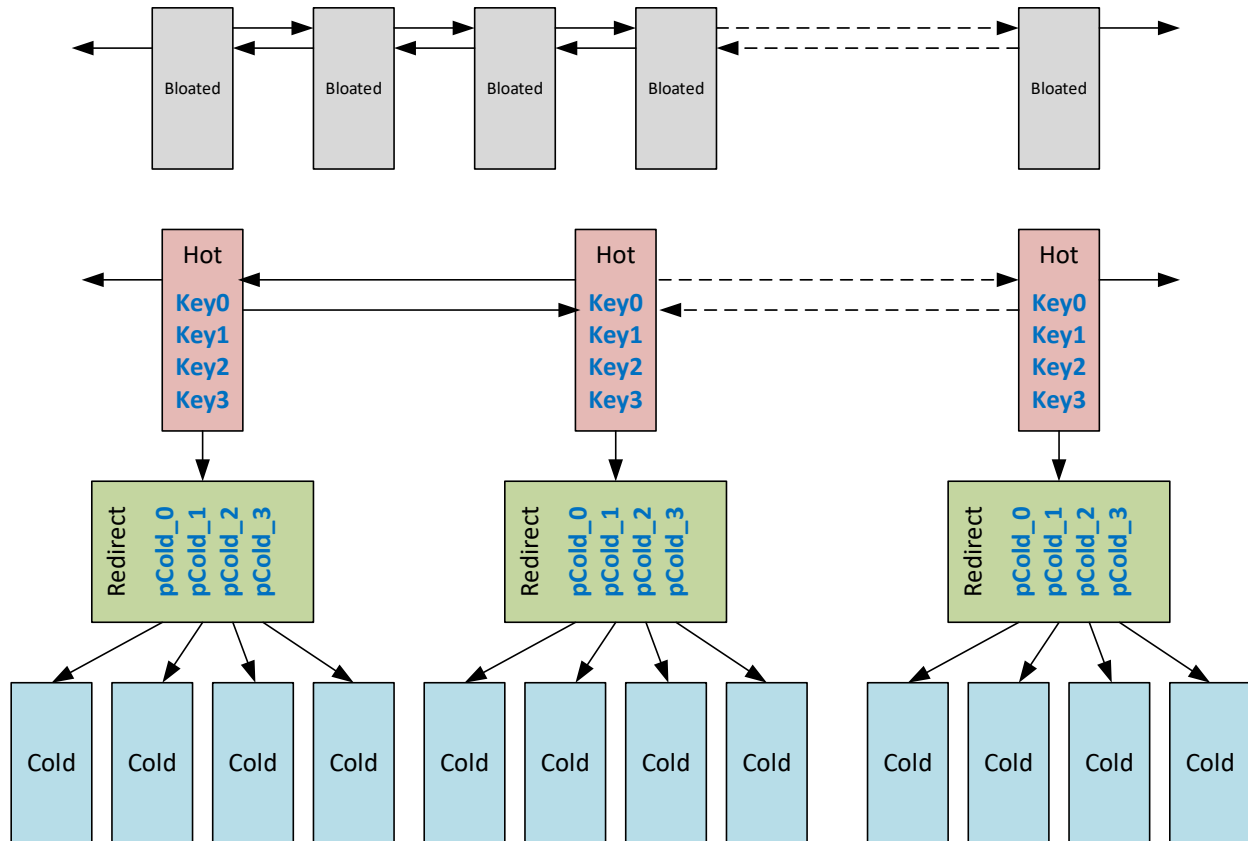

Hot/Cold list

Coding:
   - Write all programs in cross-platform C++.
     - Optimize for execution speed and robustness.
   - Refactor programming files in your student directory
     - Student directory
       - /PA2 /…
     - Make sure that program can be compiled and run through the checked in solution
   - More details for HotCold problem
     - You need to implement 4 functions:
       - ***Bloated::FindKey()*** - Find a data node in the Bloated data structure

Optimized C++
CSC 361/461

use Adobe Reader to complete

(Type in fields)

Submission Report
Keenan

- You need to search through the nodes using Linked List protocols (next/prev) – no array or indexing allowed
- Failure to use pointers and Next when searching – 0 credit
  - *HotCold::FindKey()* - Find a data node in the NEW Hot/Cold data structure
    - You need to search through the nodes using Linked List protocols (next/prev) - no array or indexing allowed
    - Failure to use pointers and Next when searching – 0 credit
  - *HotCold(Bloated *p)* - Convert from bloated to Hot/Cold data structures
    - Keep your Real-Time conversion from Bloated to HotCold fast (timing is part of the grade)
  - *~HotCold()* - destructor
    - Look at the diagram in the project to see data layout
    - ClassDiagram.cd
- Make sure you update the destructor not to leak

Jedi Hot/Cold list

- A 2-Stage concept extension to Hot/Cold
    - Jedi-Hot/Cold
        - JediHotNodes holds 8 keys per node (See *.h)
        - JediRedirect holds the 8 pointers to Cold nodes
        - JediColdNodes holds the bulk data

- More details for Jedi-HotCold problem
    - You need to implement 3 functions:
        - *JediHotCold::FindKey()* - Find a data node in the NEW JediHotNode and JediColdNode data structure
            - You need to search through the nodes using Linked List protocols (next/prev) - no array or indexing allowed
            - Failure to use pointers and Next when searching – 0 credit
        - *JediHotCold(Bloated *p)* - Convert from bloated to JediHotCold data structures
            - Keep your Real-Time conversion from Bloated to JediHotCold fast (timing is part of the grade)

- ▪ *~JediHotCold()* - destructor
    - Look at the diagram in the project to see data layout
    - ClassDiagram.cd
  - o Make sure you update the destructor not to leak

Bloated List create: 2.084526 s
   HotCold convert: 52.752403 ms

   Bloated find: 8.198001 ms
   HotCold find: 0.527900 ms

     Ratio: 15.529457

PASSED: Timing_HotCold_Test
PASSED: Jedi_Convert_HotCold_Test

--- JEDI Problem ------------------

Bloated List create: 2.058896 s
   HotCold convert: 54.599300 ms

   Bloated find: 8.591100 ms
   HotCold find: 0.171300 ms

     Ratio: 50.152359

Results:
- I included my timings
  - o You can see my timings, for reference.
    - ▪ KeenanSampleOutput_Debug.txt
    - ▪ KeenanSampleOutput_Release.txt
  - o Your timing will vary depending on your machine, but the ratios should indicate how much you improved the performance.
- Interesting results:
  - o HotCold
    - ▪ Hot/Cold (convert): 52 ms
    - ▪ Bloated (find): 8 ms
    - ▪ Hot/Cold (find): 0.52 ms
    - ▪ Ratio: 15 times faster!!!
      - Cache does yield performance improvements.
  - o Jedi – Hot/Cold
    - ▪ Jedi - Hot/Cold (convert): 54 ms
    - ▪ Jedi - Hot/Cold (find): 0.17 ms

Optimized C++

(Type in fields)

Submission Report
Keenan

- ▪ Ratio: 50 times faster!!!
  - • Cache does yield performance improvements.
- ○ You might think this is not much,
  - ▪ Most video games run at 60Hz
    - • You have 16.66ms to do your whole game per tick..
  - ▪ Reducing timing from 8 ms to 0.5 ms is quite significant.

Validation

Simple checklist to make sure that everything is submitted correctly

- • Is the project compiling and running without any errors or warnings?
- • Does the project run **_ALL_** the unit tests execute without crashing?
- • Is the submission report filled in and submitted to perforce?
- • Follow the verification process for perforce
  - ○ Is all the code there and compiles "as-is"?
  - ○ No extra files
- • Is the project leaking memory?

Hints

Most assignments will have hints in a section like this.

- • Do many little check-ins
  - ○ Iteration is easy and it helps.
  - ○ Perforce is good at it.
- • Look at the lecture notes!
  - ○ A lot of good ideas in there.
  - ○ The code in the examples work.
- • For the Alignment
  - ○ The hardest problem might be the printing
  - ○ Do printing in function - Walk and print each byte, (byte by byte)
